

ABSTRACT OF THE DISCLOSURE

A method of anti-pollution for exhaust and a device thereof provide a closed housing filled with filter materials and clearances between the filter materials. A discharge part of the exhaust is connected to an inlet hole disposed at an end of the housing and an outlet hole is disposed at another end of the housing for guiding the treated exhaust out. The exhaust is guided into the housing and a plurality of contaminating particles in the exhaust are left in the housing and the pollution resulting from the treated exhaust can be reduced greatly before being guided out from the housing.
